-!- FUNCTION: Removes the terminal stalic acid from carbohydrate side chains of the host cell surface proteins and from the viral envelope. Such a reaction prevents self-aggregation and facilitate the mobility of the virus to and from the site of infection.
-!- CATALYTIC ACTIVITY: Hydrolysis of alpha-(2->3)-, alpha-(2->6)-, alpha-(2->8)-glycosidic linkages of terminal stalic residues in oligosaccharides, glycoproteins, glycolipids, colominic acid and synthetic substrates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SEQUENCE FROM N.A.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 FUNCTION: Removes the terminal stalic acid from carbohydrate side chains of the host cell surface proteins and from the viral envelope. Such a reaction prevents self-aggregation and facilitate the mobility of the virus to and from the site of infection. CATALYTIC ACTIVITY: Hydrolysis of alpha-(2-33)-, alpha-(2-8)-glycosidic linkages of terminal stalic residues in oligosaccharides, glycoproteins, glycolipids, colominic acid and synthetic substrates.
                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MEDLINE-93212220; PubMed-8460490;

Virology Substantial stalic acid from carbohydrate side chains of the host cell surface proteins and from the viral envelope. Such a reaction prevents self-aggregation and facilitate the mobility of the virus to and from the site of infection.

CATALYTIC ACTIVITY: Hydrolysis of alpha-(2->3)-, alpha-(2->6)-, alpha-(2->6)-

                                                                                                                                                                                                                                                                                                                                   FUNCTION: Removes the terminal sialic acid from carbohydrate side chains of the host cell surface proteins and from the viral chains of the host cell surface proteins and from the viral envelope. Such a reaction prevents self-aggregation and facilitate the mobility of the virus to and from the site of infection. - CAPALYITO ACTIVITY: Hydrolysis of alpha-(2->3)-, alpha-(2->6)-, alpha-(2->8)-glycosidic linkages of terminal sialic residues in oligosaccharides, glycoproteins, glycolipids, colominic acid and synthetic substrates.

"Phylogenetic analysis of the N8 neuraminidase gene of influenza A
                                                                                                                                                                                                                                                                                                                                                                                                                                         SÜBUNIT: Homotetramer.
SUBCELLULAR LOCATION: Viral membrane. Forms a mushroom-shaped spike on the surface of the virion.
SIMILARITY: Belongs to family 34 of glycosyl hydrolases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (POTENTIAL).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Virology 193:868-876(1993).

-!- FUNCTION: Removes the terminal stalic acid from carbohydrate side chains of the host cell surface proteins and from the viral envelope. Such a reaction prevents self-aggregation and facilitate the mobility of the virus to and from the site of infection.
-!- CATALYTIC ACTIVITY: Hydrolysis of alpha-(2->3)-, alpha-(2->6)-, alpha-(2->6)-, alpha-(2->6)-, slipha-(2->6)-, slipha-(2->6)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

"Phylogenetic analysis of the N8 neuraminidase gene of influenza A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             -i- SÜBÜNIT: Homotetramer.
-i- SUBCELÜULAR LOCATION: viral membrane. Forms a mushroom-shaped
spike on the surface of the virion.
-i- SIMILARITY: Belongs to family 34 of glycosyl hydrolases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (POTENTIAL).

Virology 193:868-876(1993).

-!- FUNCTION: Removes the terminal sialic acid from the viral chains of the host call surface proteins and from the viral envelope. Such a reaction prevents self-aggregation and facilitate the mobility of the virus to and from the aite of infection.

-!- CATALYTIC ACTIVITY: Hydrolysis of alpha-(2->3)-, alpha-(2->6)-, alpha-(2->8)-glycosidic linkages of terminal sialic residues in oligosaccharides, glycoproteins, glycolipids, colominic acid and synthetic substrates.
                                                                                                                                                                                                                                                                                                                              Saito T., Kawaoka Y., Webster R.G.; "Phylogenetic analysis of the N8 neuraminidase gene of influenza A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  -i. SUBCELLUAR LOCATION: Viral membrane. Forms a mushroom-shaped spike on the surface of the virion.
-i. SIMILARITY: Belongs to family 34 of glycosyl hydrolases.
                                                                                                                               Influenza A virus (strain A/Herring gull/DE/677/88).
Viruees; seRNA negative-strand viruses; Orthomyxoviridae;
Influenza A viruses; Influenzavirus A.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Virialogy 193:868-876(1993).

Virialogy 193:868-876(1993).

-!- FUNCTION: Removes the terminal sialic acid from carbohydrate side chains of the host cell surface proteins and from the viral envelope. Such a reaction prevents self-aggregation and facilitate the mobility of the virus to and from the site of infection.

-!- CATALYTIC ACTIVITY: Hydrolysis of alpha-(2->3)-, alpha-(2->6)-, alpha-(2->8)-glycosidic linkages of terminal sialic residues in oligosaccharides glycoproteins, glycolipids, colominic acid and synthetic substrates.

-!- SUBUNIT: Homotetramer.

-!- SUBUNIT: Homotetramer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                     FUNCTION: Removes the terminal stalic acid from carbohydrate side chains of the host cell surface proteins and from the viral envelope. Such a reaction prevents self-aggregation and facilitate the mobility of the virus to and from the site of infection.
CATALYTIC ACTIVITY: Hydrolysis of alpha-(2-33)-, alpha-(2-56)-, alpha-(2-8)-glycosidic linkages of terminal stalic residues in oligosaccharides, glycoproteins, glycolipids, colominic acid and synthetic substrates.
SUBUNIT: Homocetramer.
SUBCELULAR LOCATION: Viral membrane. Forms a mushroom-shaped spike on the surface of the virion.
SIMILARITY: Belongs to family 34 of glycosyl hydrolases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gapa

                                                                                                                                                                                                                                 Virology 193:868-876(1993).

-!- FUNCTION: Removes the terminal sialic acid from carbohydrate side chains of the host cell surface proteins and from the viral envelope. Such a reaction prevents salf-aggregation and facilitate the mobility of the virus to and from the site of infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                             CATALYTIC ACTIVITY: Hydrolysis of alpha - (2->3) -, alpha - (2->6) -, alpha - (2->6)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

"Effect of hypoxia on the microvasculature of developing fetal
brain of sheep: a studies on the expression pattern of
constitutive forms of nitric oxide synthase.";
Submitted (OCT-1996) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Produces nitric oxide (NO) which is implicated in
vascular smooth muscle relaxation through a CGMP-mediated signal
transduction pathway. No mediates vascular endothelial growth
factor (VEGF)-induced angiogenesis in coronary vessels and

-I- FUNCTION: Aerolysin is a cytolytic toxin exported by the Gram negative Aeromonas bacteria. The mature toxin binds to eukaryotic cells and aggregates to form holes approximatively 3 nm in diameter, leading to destruction of the membrane permeability barrier and osmocic lysis (By similarity).

-I- SUBUNIT: Homodimer in solution; heptamer in the membrane (By

reduction defects in endothelial nitric oxide synthase-deficient
                                                                                                                                                                         nitric oxide + N NADP(+). COFACTOR: Heme. Binds one mole each of FAD and FWN. Also requires tetrahydrobiopterin (BH4) which may stabilize the dimeric form of
           Am. J. Physiol. 275:H2319-H2324(1998).

Am. J. Physiol. 275:H2319-H2324(1998).

-I. Physiol. 275:H2319-H2324(1998).

-I. Provided the produces nitric oxide (NO) which is implicated in vascular smooth muscle relaxation through a cGMP-mediated signal transduction pathway. No mediates vascular endothelial growth factor (NGGF)-induced angiogenesis in coronary vessels and promotes blood clotting through the activation of platelets. May play a significant role in normal and abnormal limb development.

-I. CATALYTIC ACTIVITY: L.arginine + N NADPH + M O(2) = citrulline +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PROSITE; PS50902; FLAVODOXIN_LIKE; 1.

blood platelets.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      vascular smooth muscle relaxation through a cGMP-mediated signal transduction pathway. No mediates vascular endothelial growth factor (VEGF)-induced angiogenesis in coronary vessels and promotes blood clotting through the activation of platelets.

CATALYTIC ACTIVITY: L-arginine + N NADPH + M O(2) = citrulline + nitric carde + N NADP (+).

COPACTOR: Heme. Binds one mole each of FAD and FMN. Also requires tetrahydrobiopterin (BH4) which may stabilize the dimeric form of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             "Conformational changes in nitric oxide synthases induced by "Conformatione and nitroindazoles: crystallographic and computational analyses of inhibitor potency."; Biochemistry 41:13915-13925 (2002).

T. Structural basis for pterin antagonism in nitric-oxide synthase.

Development of novel 4-oxo-pteridine antagonists of (RN -5, 6, 7, 8-tetrahydrobiopterin.";

L. J. Biol. Chem. 256:49133-49141(2001).

- I- FUNCTION: Produces nitric oxide (NO) which is implicated in vascular smooth muscle relaxation through a cGMP-mediated signal tranduction pathway. No mediates vascular endothelial growth factor (VEGF) induced angiogenesis in coronary vessels and promoces blood clotting through the activation of platelets.

- I- CATALYTIC ACTIVITY: Larginine + N NADPH + M O(2) = citrulline +
                                                                                                                                         Raman C.S., Li H., Martasek P., Babu B.R., Griffith O.W., Southan G., Masters B.S.S., Poulos T.L.; "Implications for isoform-selective inhibitor design derived from the binding mode of bulky isothioureas to the heme domain of endothelial nitric-oxide synthase."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      nitric oxide + N NADP(+).

COFACTOR: Heme. Binds one mole each of FAD and FMN. Also requires tetrahydrobiopterin (BH4) which may stabilize the dimeric form of

Dev. Brain Res. 111:271-277 (1998).

-!- FUNCTION: Produces nitric oxide (NO) which is implicated in vascular smooth muscle relaxation through a cGMP-mediated signal transduction pathway. No mediates vascular endothelial growth factor (VEGF)-induced anglogenesis in coronary vessels and promotes blood clotting through the activation of platelets (By

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SUBUNIT: MONOMER.
INDUCTION: WHEN E.COLI CELLS ARE EXPOSED TO DOSES OF DNA ALKYLATING AGENT. IT IS NOT INHIBITED BY REACTION PRODUCTS.
SIMILARITY: Belongs to the alkylbase DNA glycosidase alka family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            O->A: METHYLMETHANE SULFONATE-RESISTANT.

FUNCTION: HYDROLYSIS OF THE DEOXYRIBOSE N-GLYCOSIDIC BOND TO EXCISE 3-METHYLADBINE, 3-METHYLADBINE, 7-METHYLADBINE, OO-METHYLTHYMINE, AND O2-METHYLCYTOSINE FROM THE DAMAGED DNA POLYWER FORMED BY ALKYLATION LESIONS.

GATALYTIC ACTIVITY: Hydrolygis of alkylated DNA, releasing 3-methyladenine, 3-methyladenine, and 7-
"A 460-kb DNA sequence of the Escherichia coli K-12 genome corresponding to the 40.1-50.0 min region on the linkage map."; DNA Res. 3:379-392(1996).

                                                                                                                                                                                                                                             "adult # 10/12/07.
"In PUNCTION: Conversion of folates to polyglutamate derivatives.
-!- CATALYTIC ACTIVITY: ATP + {tetrahydrofoly1-{Glu}} (N) + L-glutamate
= ADP + phosphate + {tetrahydrofoly1-{Glu}} (N+1).
-!- CATALYTIC ACTIVITY: ATP + dihydropterate + L-glutamate = ADP +
phosphate + dihydrofolate +
-!- PATHWAY: Folate biosynthesis.
-!- SAMILARITY: Belongs to the folylpolyglutamate synthase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              01-FEB-1995 (Rel. 31, Created)

                                                                                                                                                                                   Gen. Microbiol. 137:2705-2711(1991).

Gen. Microbiol. 137:2705-2711(1991).

PUNCTION: Phospholipase hydrolyzing both fatty acid esters of phospholipid, i.e., it hydrolyzes phosphatidylcholine (PC) to lysophosphatidylcholine (LPC) and then LPC to glycerophosphorylcholine (GPC).

SUBCELLULAR LOCATION: Secreted.

- PTM: There are two forms of LDH. The LDH(S) may be a protein in which 13 residues of the N-terminal of LDH(L) are deleted.

- SIMILARITY: Belongs to the "GDSL" family of lipolytic enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

-!- SUBUNIT: Homoterramer.
-!- SUBCELLULAR LOCATION: Viral membrane. Forms a mushroom-shaped spike on the surface of the virion.
-!- SIMILARITY: Belongs to family 34 of glycosyl hydrolases.

Nature 290:213-217(1981).

-!- FUNCTION: Removes the terminal sialic acid from carbohydrate side chains of the host cell surface proteins and from the viral envelope. Such a reaction prevents self-aggregation and facilitate the mobility of the virus to and from the site of infection.

-!- CATALYTIC ACTIVITY: Hydrolysis of alpha-(2-3)-, alpha-(2-5-6)-, alpha-(2-8)-glycosidic linkages of terminal sialic residues in oligosaccharides, glycoproteins, glycolipids, colominic acid and synthetic gubstrates.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           "Sequence analysis of the genome of the unicellular cyanobacterium Synechocystis sp. strain PCC6803. II. Sequence determination of the entire genome and assignment of potential protein-coding regions."; DNA Res. 3:109-136(1996).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ô
animal and plant pathogens and symbionts.";

Proc. Natl. Acad. Sci. U.S.A. 99:13148-13153(2002).
-!- FUNCTION: GTPase of unknown physiological role.
-!- SIMILARITY: Belongs to the era/trmE family of GTP-binding proteins. EngA subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             01-NOV-1995 (Rel. 32, Created)
